Summary

I am a theoretical and computational physicist with a decade-long track record in research, marked by the authorship of 16+ papers in condensed matter physics, mathematical physics (nonlinear PDEs), and nonlinear optics and dynamics. I enjoy unraveling complex puzzles across diverse domains, often integrating techniques from other fields and thriving in collaborative work environments. My work seamlessly blends analytical and computational methods. I specialize in crafting solutions from the ground up, starting with simple yet insightful models solvable on a blackboard and progressively adding layers of complexity that demand the capabilities of supercomputers.

Education

PhD, Physics	2019 – Expected May 2025
University of California, Berkeley	<i>Advisor:</i> Sinéad M. Griffin
<i>Research Area:</i> Theoretical and Computational Condensed Matter Physics	
MA, Physics	2019 – 2020
University of California, Berkeley	
MS, Applied Physics (AS&T, College of Engineering)	2017 – 2019
University of California, Berkeley	
<i>Thesis:</i> The Nonlinear Schrödinger Hierarchy: from Quasi Rogue Waves to Nonlinear Talbot Carpets	GPA: 3.90
BS, Electrical Engineering (Optics)	2013 – 2017
Texas A&M University	
<i>Thesis:</i> Maximal Intensity Higher-Order Breathers of the Nonlinear Schrödinger Equation	GPA: 4.00

Research Projects

- Efficient Solvers for Nonlinear Schrödinger-type PDEs in Julia [\[arXiv\]](#) [Independent Project](#)
- Conceived and developed the Julia package `NonlinearSchrodinger.jl` [from the ground up](#), specifically tailored for efficiently solving classically integrable nonlinear Schrödinger-type partial differential equations (PDEs).
 - Implemented the Darboux transformation method to compute analytical solutions of PDEs with as many as 18 terms.
 - Carefully fine-tuned and implemented 32 numerical algorithms for maximum versatility within this specialized problem domain, emphasizing a performance-oriented approach that enables rapid modeling on personal computers.
 - Augmented the package with a user-friendly API and data visualization tools, enabling the computation and analysis of complex solutions with just a few lines of code.

Advancing Quantum Sensing: Quantum Materials for Dark Matter Detection PI: Sinéad Griffin

- Utilized analytical models and massively parallel numerical methods to propose novel quantum sensors that utilize a symmetry-breaking mechanism for dark matter detection, complementary to existing superconducting sensors.
- Collaborated with high-energy theorists, condensed matter experimentalists, and materials scientists to assess the feasibility of proposed ideas given current and next-generation experimental capabilities.
- Implemented GPU-accelerated nonlinear coupled PDE solvers using Julia and `DifferentialEquations.jl` to explore pattern formation in multiferroic materials.
- Developed Python packages, soon to be open-sourced, and contributed to both open-source and proprietary Python and FORTRAN projects that were instrumental in streamlining the analysis of terabytes of calculated data.

Insights into the Nonlinear Schrödinger Hierarchy of PDEs PIs: Siu Chin, Milivoj Belić

- Published nine papers presenting and proving various mathematical results within the hierarchy, including the peak-height formula for computing the intensity of arbitrary solutions.
- Devised a scheme for generating complex solutions in optical fibers, paving the way for experimental observation.
- Utilized analytical methods like Darboux transformations, complemented with numerical approaches such as finite differences and symplectic integrators implemented in MATLAB, Python, and C/C++ with CUDA.

Skills and Tools

Programming	Python; Julia; MATLAB; FORTRAN; C/C++, shell.
Numerical Modeling	Nonlinear, coupled, and diffusion PDEs; finite difference, spectral methods, and symplectic integrators; electronic structure methods (DFT, classical Monte Carlo, etc.).
High-Performance Computing	Nine years of experience with HPC clusters. Proficient in CPU (MPI, OpenMP) and GPU (OpenACC, CUDA-aware MPI) computing and massively parallel applications.
Dev Tools	Git; CI/CD; Docker; SQL (PostgreSQL) and NoSQL (MongoDB) databases.
Web Development	Dash; Flask; Gunicorn; Kubernetes; CSS (Bootstrap); Javascript (jQuery). Independently developed the full stack for an upcoming web tool for sharing and analyzing electronic structure software input files.

Selected Fellowships and Awards

Berkeley Graduate Fellowship, University of California, Berkeley 2017 – 2019

A highly competitive fellowship that enabled me to dedicate two years during my MS degree to independent research in two subfields of physics, resulting in the publication of five research articles.

Richard E. Ewing Award for Excellence in Student Research, Texas A&M University 2016

Awarded as a junior, out of a pool including seniors and recent graduates, for outstanding research achievement, including two publications in mathematical physics and nonlinear dynamics.

Miscellaneous

Certificates: Blockchain Fundamentals ([BerkeleyX on edX](#)).

Languages: English (bilingual), Arabic (bilingual), Spanish/French/German (elementary).

Volunteering: Be A Scientist (6-week program, Grade 7), Scientist Ambassador (4-week program, Grade 1.)

Erdős Number: 4

Addendum: Publications and Preprints
